

- Is there a need for a ROA Environmental (& Other?) Policy Resource Centre?
- Database (examples: Biotech; EVRI environmental non-market valuation e-resources)?

### Summary

The northeast region of Brazil is rich in wind and solar resources, but electricity demand fluctuates.

Excess energy has the flexibility to be converted into green hydrogen.

Green hydrogen is a clean and renewable energy source that can be used to store electricity or be directly used as fuel.

This helps to manage the variability of the wind and solar resources and provides a long-term storage solution for the excess energy.
